CLAY UNIT MASONRY

CONSULTANT DESIGN GUIDELINE

MASONRY WALLS. Design masonry walls with a clear cavity width of two inches, excluding the insulation, for removal of mortar droppings between Wythes.

WALL TIES. Specify adjustable ties with attachable drips to be located within the cavity. Do not permit corrugated, galvanized wall ties.

Masonry anchors should be the type that can be applied on the exterior of the sheathing and that they be able to take vertical movement (slide up and down). One brand that is good for this is HB anchor, the x-seal or approved equal. It also assists in keeping water out of its penetrations.

INCLUDE IN CONSTRUCTION DOCUMENTS

Multiple Wythe Joint Reinforcement. Truss type with moisture drip galvanized 3/16" rods with nine gage cross tile.

Masonry Flashing End Laps. Send end laps in through-wall flashing with mastic; a six-inch lap is required.

Discontinuous Flashing. Turn flashing up two inches to form a dam at each end where through-wall flashing is discontinuous, such as locations above doors and windows. Provide positive weeps in head joints of the outer masonry, just above the flashing, for water drainage.

EXECUTION

Sample Wall Panels. Prior to installation of masonry, and at no cost to the University, erect three sample masonry wall panels to display three different brick samples for review and selection by the University Facilities Management Planning Group.

Contractor shall construct masonry panels no less than 4' x 6' in size. Samples panels shall be full thickness, including face and backup Wythes, and include all accessories. Do not allow masonry cement in mortar.

Locate masonry panels on site in locations indicated or, if not indicated, as directed by the Architect.

Do not proceed with masonry work until masonry panels approved by the architect and Facilities Management Planning Group.
