Consultant Design Guideline

   Building Service Entrance (Rev 11-15-2018)

Electrical Load Calculations:

1.01 General: The electrical system designer shall calculate the estimated peak building demand for electricity. The calculated peak demand shall consider load diversity. The calculations shall identify the peak electrical demand associated with each energy system including air handling systems, heating water system, chilled water system, domestic hot water system, elevators, exhaust fans, interior lighting, exterior lighting, and miscellaneous equipment1. The electrical system designer shall also determine the appropriate capacity of the building primary transformer.
CONSULTANT DESIGN GUIDELINE

Rate all primary cables at 15,000 volts. Rate all distribution transformers at 15,000-volt primary with a nominal center tap voltage rating of 12,470 volts.

INCLUDED IN CONSTRUCTION DOCUMENTS

Specify all cables inside tunnels to be galvanized steel interlocked armor with a ground and jacket or single conductors in rigid galvanized steel conduit.

All buried medium voltage electrical shall have PVC conduit encased in red concrete at 30", minimum, depth.

Specify high voltage caution signs to be placed on all high voltage splice and pull boxes.

All primary electrical feeder terminations in the switchgear transformer cubical, etc., shall have dead front construction.

All new building construction or renovation that involves replacement or upgrade of the medium voltage switchgear or replacement of the primary transformers shall include a means of providing the building with a looped primary feed. The switch shall have a minimum of three ways: loop in, loop out, and building feed. Coordinate the design with Facilities Management to include appropriate duct bank access to the switch for future growth.

END SECTION
CONSULTANT DESIGN GUIDELINE
Minimum size for all conductors other than control wiring shall be #12.

Cable and wire shall be new, unspliced, annealed copper. **Aluminum conductors shall not be allowed.** Cable and wire shall be stranded for sizes #8 and larger and shall be solid for sizes #10 and smaller.

Insulation shall be THW, XHHW, or dual rated THHN-THWN, UL 44, 83 and 493.

Controls, communication, and signal wiring shall be stranded copper and shall conform to the recommendations of the manufacturers of the particular systems. Unless otherwise specified in other sections of these specifications, size control wiring as specified for power and lighting wiring, except that the minimum size shall be not less than #16. Multi-conductor cables shall have the conductors color-coded.

INCLUDE IN CONSTRUCTION DOCUMENTS

Splice and joint connectors shall comply with UL 486 A, B, D, and NEC.

Connectors for branch circuits (#10 and smaller) shall be solderless, screw-on, reasonable pressure cable type, 600 volt, 105 degree C. with integral insulation, approved for copper conductors. The integral insulator shall have a skirt that completely covers the stripped wires.

Connectors for feeder circuits shall be as follows: Connectors shall be indent, hex screw, or bolt clamp-type of high conductivity and corrosion-resistant material.

Field installed compression connectors for cable sizes 250 MCM and larger shall have not less than two clamping elements or compression indents per wire. Insulation materials for splices and joints shall be approved for the particular use, location, voltage, and temperature. Insulate with not less than that of the conductor level that is being joined. Plastic electrical insulating tape shall comply with Fed Spec HH-I-595. Tape shall be flame retardant and cold weather resistant.

Wire lubricant shall be suitable for the wire insulation and conduit it is used with, and shall not harden or become adhesive. Prohibit wire lubricant on wire for isolated type electrical power systems.
EXECUTION

Install all wiring in raceway systems.

Install cable supports for all vertical feeders in accordance with the NEC. Provide split wedge type, which firmly clamps each individual cable and tightens due to cable weight.

For panelboards, cabinets, wireways, switches, and equipment assemblies, neatly form, train, and tie the cables in individual circuits.

Seal cable and wire entering a building from underground between the wire and conduit, where the cable exits the conduit, with a non-hardening approved compound.

Color-code secondary service, feeder, and branch circuit conductors as follows:

<table>
<thead>
<tr>
<th>PHASE</th>
<th>120/208 or 120/240</th>
<th>277/480</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Red</td>
<td>Brown</td>
</tr>
<tr>
<td>B</td>
<td>Blue</td>
<td>Orange</td>
</tr>
<tr>
<td>C</td>
<td>Black</td>
<td>Yellow</td>
</tr>
<tr>
<td>Neutral</td>
<td>White *</td>
<td>Gray</td>
</tr>
<tr>
<td>Ground</td>
<td>Green</td>
<td>Green</td>
</tr>
</tbody>
</table>

*or white with colored (other than green) tracer.

For phase conductors #8 and larger, color code using one of the following:

Solid color compound or solid color coating.

Stripes, bands, or hash marks of color specified above.

Color as specified using ¼" wide tape. Apply tape in half overlapping turns for a minimum of three inches for terminal points, and in junction boxes, pull boxes, troughs, manholes, and handholes. Apply the last two laps of tape with no tension to prevent possible unwinding. Where cable markings are covered by tape, apply tags to cable stating size and insulation type.

For modifications and additions to existing wiring systems, color-coding shall conform to the existing wiring system.

Splice cables and wires only in outlet boxes, junction boxes, pull boxes, manholes, or handholes. No splices shall be concealed within conduit. The number, size, and combination of conductors shall be in strict compliance with listed guidelines on the connector manufacturer's packaging. Splices and terminations shall be mechanically and electrically secure.
Control voltage (24 V, maximum) conductors may be installed without conduit above lay-in ceilings with permission from local authority having jurisdiction. The following conditions must be met:

Conductors shall be neatly bundled and "zip tied" to bottom chord of joists or to conduit on ten foot intervals. Conductors shall not be laid loosely on ceiling tiles.

All wiring in utility rooms and closets shall be neatly bundled and "zip tied" to nearest available strut, conduit, or pipe. Where no strut, conduit, or pipe is available, install wire in plastic raceway.

Install all wiring in walls, above gypsum board ceilings, or in occupied areas that have no ceiling in conduit.

Size wire sufficiently large that the voltage drop under in rush conditions does not adversely affect operation of the controls (maximum of 3% volt drop from source of power to end use).

Except where otherwise required, install a separate power supply circuit for each system in order that malfunctions in any system will not affect other systems.

Where power supply circuits are not shown for systems, connect them to the nearest panelboards of suitable voltages, which are intended to supply such systems and have suitable spare circuit breakers or space for installation.

Install a breaker lock on the branch circuit breaker for the power supply circuit for each system to prevent accidental de-energizing of the systems.

Install insulated crimp type forked lugs on control wiring that is to be connected to terminal strips. Size lugs properly for both the wire and the terminal strip. Use forked lugs unless the controls manufacturer specifies ring type.

Install a permanent wire marker on each wire at each termination. Identifying numbers and letters on the wire markers shall correspond to those on the wiring diagrams used for installing the systems.

In each pull box and junction box, install metal tags on each circuit cables and wires to designate clearly their circuit identification and voltage.

Feeders and branch circuits shall have their insulation tested after installation and before connection to utilization devices such as fixtures, motors, or appliances. Test shall be performed by meter and conductors and shall test free from short-circuits and grounds. Test conductors phase-to-phase and phase-to-ground. Meter motors after installation but before start-up and test free from grounds.

26 05 19.13 Under Carpet Electrical Power Cables

26 05 23 Control-Voltage Electrical Power Cables
26 05 26 Grounding and Bonding for Electrical Systems
26 05 29 Hangers and Supports for Electrical Systems

**SECTION 26 05 33**
**RACEWAY AND BOXES FOR ELECTRICAL SYSTEMS** (Rev 08/28/2018)

**CONSULTANT DESIGN GUIDELINE**
Install all wiring in conduit.

Conduit shall be rigid, galvanized, heavy wall steel, for sizes 2½” and larger. Conduit less than 2½” in diameter shall be electrical metallic tubing (EMT), except where installed in slabs on grade, underground, building exterior, or where prohibited by Code, in which case rigid metallic conduit as described above shall be used.

At the Contractor's option, rigid aluminum conduit may be used in lieu of rigid steel conduit in sizes 2½” and larger, except aluminum conduit shall not be buried in concrete or directly in earth.

At the Contractor's option, PVC conduit may be used for underground conduit runs in the horizontal portion only. Rigid metallic conduit shall be required for elbows and vertical transitions for all underground conduit installations.

At the Contractor's option, conduit 2½” and larger may be electrical metallic tubing (EMT) only in interior applications where the conduit is installed concealed within the building ceiling space and non-masonry wall constructions.

**INCLUDE IN CONSTRUCTION DOCUMENTS**

Conduit size shall be in accordance with the NEC, but not less than ¾” unless otherwise shown. Where permitted by the NEC, ½” flexible conduit may be used for tap connections to recessed lighting fixtures and ¾” flexible conduit may be used for tap connections to handy boxes in existing walls. (Rev 08/28/2018)

Conduit shall not be required for control voltage conductors except fire alarm system wiring system shall have red anodized EMT conduit. (Rev 08/28/2018)

Design pipe straps specifically for use with electrical conduit; "plumbers tape" shall not be accepted. Design individual conduit hangers for the purpose, having a pre-assembled closure bolt and nut, and provisions for receiving a hanger rod. Multiple conduit (trapeze) hangers shall not be less than 1½” by 1½”, 12 gauge steel, cold-formed, lipped channels; with not less than (?)” diameter steel hanger rods. Solid masonry and concrete anchors shall be steel collet type. Wooden dowels and plastic type anchors shall not be acceptable. Design clamps to be used for attaching to beams, trusses, and joists. Clamps designed to be used for attaching to piping, lay-in ceiling grid, etc. shall not be acceptable.
Outlet, junction, and pull boxes shall comply with UL 50 and UL 514A. Boxes shall be cast metal where required by the NEC or shown, and equipped with rustproof box covers. Sheet metal boxes shall be galvanized steel except where otherwise shown.

Wireways shall be equipped with hinged covers, except where removable covers are shown. All cover assemblies shall contain captive retaining screws.

EXECUTION

Cut holes through concrete and masonry in new and existing structures with a diamond core drill or concrete saw. Pneumatic hammer, impact electric, hand or manual hammer type drills are not allowed, except where permitted by the Engineer as required by limited working space.

Where conduits, wireways, and other electrical raceways pass through fire partitions, firewalls, smoke partitions, or floors, install a fire stop that provides an effective barrier against the spread of fire, smoke and gases with approved materials. Completely fill and seal clearances between raceways and openings with the fire stop material.

At floor, exterior wall, and roof conduit penetrations, completely seal clearances around the conduit and make watertight.

Contractor shall furnish and install all sleeves and inserts for all electrical work passing through, or attaching to, walls, floors, or ceilings. Install conduits passing through designated fire/smoke rated structure with appropriately rated sleeves and inserts to maintain the integrity of the rated wall/floor/ceiling structure. Installation shall conform to NFPA, NEC, and U.L. standards.

Install essential (emergency) raceway systems independently of other raceway systems, excluding those specifically "excepted" by NEC.

Install conduit as follows:

Install conduit in complete runs before pulling in cables or wires.
Assure conduit installation does not encroach into the ceiling height headroom, walkways, or doorways.
Conduit shall be mechanically and electrically continuous.
Independently support conduit. Do not support conduit with suspended ceilings, suspended ceiling supporting members, lighting fixtures, mechanical piping, or mechanical ducts.
Support conduit within 12" of changes of direction, and within 12" of each enclosure to which connected.
Conduit installations under fume and vent hoods are prohibited.

Install conduit in concrete as follows:

Conduit shall be rigid steel or EMT; except do not install EMT in concrete slabs that are in contact with soil, gravel or vapor barriers.
Align and run conduit in direct lines parallel or perpendicular to building lines. Prohibit installation of conduit in concrete that is less than 3” thick. Prohibit conduit outside diameter larger than 2 of the slab thickness. Space between conduits in slabs shall be approximately six conduit diameters apart, except one conduit diameter at conduit crossings. Install conduits approximately in the center of the slab so that there will be a minimum of ¾” of concrete around the conduits. Couplings and connections shall be watertight. Use thread compounds that are UL approved conductive type to insure low resistance ground continuity through the conduits.

Use flexible metal conduit for connections to motors and other electrical equipment subject to movement, vibration, misalignment, cramped quarters, or noise transmission. Provide liquid-tight flexible metal conduit for installation in exterior locations, moisture or humidity-laden atmosphere, corrosive atmosphere, water, or spray wash-down operations, and locations subject to seepage or dripping of oil, grease, or water. Provide a green ground wire with flexible metal conduit.

Equip conduits three inches and larger, that are rigidly secured to the building structure on opposite sides of a building expansion joint, with expansion and deflection couplings. Install the couplings in accordance with the manufacturer’s recommendations. Provide conduits smaller than 3” with junction boxes on both sides of the expansion joint. Connect conduits to junction boxes with 15” of slack flexible conduit. Flexible conduit shall have a copper green ground bonding jumper installed. In lieu of this flexible conduit, expansion and deflection couplings as specified above for 3” and larger conduits are acceptable.

Use wire mold raceway, or equal, for work on existing masonry walls in finished areas. Anchor wire mold on 30” centers. Size wire mold as per manufacturer’s guidelines.

In areas where Contractor is having trouble installing concealed wiring and/or conduit, consult the Architect about using wire mold.

END SECTION

26 05 36 Cable Trays for Electrical Systems
26 05 39 Underfloor Raceways for Electrical Systems
26 05 43 Underground Ducts and Raceways for Electrical Systems
26 05 46 Utility Poles for Electrical Systems
26 05 48 Vibration and Seismic Controls for Electrical Systems
26 05 53 Identification for Electrical Systems
Identification of equipment

Identification/tagging/tracking of equipment that requires preventive maintenance, on some periodicity, to maximize its operational lifespan is essential. If the equipment will never require any service it need not be entered into our system. Our primary concern is to identify equipment (including mechanical, electrical, and plumbing) that needs to be checked and serviced on a regular basis. An online form [link provided below] facilitates entry of all information needed to input and track equipment in the UA Facilities Management Department's Computerized Maintenance Management System (CMMS). The following process, business rules, and information requirements apply.

**INFORMATION NEEDED**

1. Barcode tag number
2. Equipment nomenclature
3. Manufacturer
4. Model
5. Serial number (if available)
6. Building name
7. Room number
8. Recommended preventive maintenance procedures and frequencies (i.e. monthly, quarterly, semi-annually, annually)
9. Parts requirements for procedures/frequencies stated in item eight
10. Special conditions for access, unusual tools needed, et cetera should be noted in comments
11. If project is a renovation rather than new construction, report removed equipment by its (old) barcode tag number or by completing items two through seven of a data entry form for each piece of equipment being removed

Link for the new equipment entry form for contractors to use to enter newly installed equipment on campus:

[http://facilities.uark.edu/Forms/NewEquipmentEntryForm.htm](http://facilities.uark.edu/Forms/NewEquipmentEntryForm.htm)

**PROCESS**

1. Consult business rules on how newly installed building components and equipment are categorized in FAMIS to determine new equipment count
2. Acquire the necessary number of barcode tags from the Facilities Management CMMS Administrator
3. Tag equipment and complete associated data entry forms
4. If project is a renovation rather than new construction, report removed equipment, by FAMIS number or by completed data entry form, to the Facilities Management CMMS Administrator.
5. Supply all applicable digitized owner's manuals, user's manuals, maintenance manuals, parts lists, et cetera to the Facilities Management Construction Coordinator who will then give a copy to the Facilities Management CMMS Administrator.
6. Resolve data discrepancies identified by the Facilities Management CMMS Administrator.

BUSINESS RULES

1. Components that are cheaper to replace than maintain will not be included
   a. If in doubt, err on the side of identifying and documenting Components
2. Systems or Components with a minimum maintenance frequency of greater than one year will not be included
   a. If in doubt, err on the side of identifying and documenting Systems and Components
3. All inventory items will receive a new metal barcode tag
4. Barcode tags will be affixed using self-adhesive unless the inventory item is located outside or there is not an appropriate surface for adhesion
5. Use plastic zip ties or wire twist ties to affix the barcode tags to items described in the previous rule
6. Major Components of Parent Systems will be labeled according to the following rules:
   a. The Major Component has a replacement value of >= $500
   b. The frequency with which the Major Component is repaired/replaced is greater than the life of the Parent System
   c. The Pump or Motor (Major Component) is >= 2 HP (This does not include Sump Pumps. Inventory all Sump Pumps)
   d. The Equipment ID of the Parent System shall be recorded accordingly on the Inventory Template of the Major Component that is being barcoded
7. Barcode and record all Heat Pumps, Evaporators and Condensing Units individually if their capacity exceeds 5 tons
8. Please record the following inventory items on a per floor basis, using one barcode tag per floor. Record locations of individual units and any unusual access or tool requirements individually in comments.
   a. Fan Coil Units
   b. Exit Lighting & Emergency Egress Lighting
   c. Eye Wash Stations
   d. Emergency Showers
   e. Electronic Handicapped Access Door Operators
9. Please record the following inventory items on a per building basis, using one barcode tag per category. Record locations of individual units and any unusual access or tool requirements individually in comments.
   a. Emergency Egress Doors
   b. Heat Pumps, Evaporators and Condensing Units with a capacity of <= 5 tons
   c. Bathrooms
   d. Drinking Fountains
   e. Recirculating Pumps
   f. Interior Doors
   g. Fire Doors
10. Major Systems or Components (i.e. Elevators and Sprinkler Risers) of value >= $1,000 shall be considered an inventory item even if the PM is outsourced
11. All Regulatory Code Reporting Items, such as backflow protection devices, expansion tanks, flash tanks, and steam converters) shall be included in the inventory
12. Individual pumps in duplexed configurations shall each be tagged as individual pieces of equipment. Note duplexed installations in comments.

26 05 73 Overcurrent Protective Device Coordination Study

ARC FLASH STUDY (Rev 11-15-2018)

Consultant Design Guideline

It is the intent of the University of Arkansas to comply with the Arc Flash requirements as provided for in NFPA 70E, Standard for Electrical Safety in the Workplace. The responsibilities and scope of work for design professionals and contractors for major renovation and new construction projects are to deliver to the University at the time of turnover, a system that fulfills the labeling requirements under the standard (See Appendix W for this standard), and that meet the analysis criteria as specified in IEEE Standard 1584.

The consultant specifications shall require the general contractor to deliver a completed arc flash study stamped by a professional engineer, complete with both electronic and hard copy report. The deliverable shall also include the electronic computer modeling files for the fault current, coordination, and arc flash calculations. The University prefers that the analysis be performed using SKM xxx, by Company, though it is not a requirement.
The consultant specification shall be structured to require a two step analysis process. The first step shall be based on the approved electrical equipment supplier submittal documents and reasonable assumptions for the installed condition. The model shall be run for the final deliverable report based on the as built condition, using actual cable lengths and the approved coordination protective device settings prior to the generation and installation of Arc Flash labeling.

The University can assist during the design process to insure that the contract documents comply with the requirements of this section. The UofA Will provide the available fault current at the MV Service entrance based on the current version of the campus power distribution fault current & protective device coordination model. (Rev 11-15-2018)

26 09 23 Lighting Control Devices (Rev 08/28/2018) Note: this section of the A&E is a “DRAFT”, check with FAMA Dept.

PART 1. GENERAL

Performance criteria and goals for sustainable and energy-efficient new and major renovation buildings to follow ASHRAE 90.1 2007, as adopted by the State of Arkansas in April 2009. Buildings must be designed, constructed, and certified to at least 10% reduction below the baseline energy consumption determined by the performance rating method of Appendix G of ASHRAE 90.1 2007.
Lighting Control Manufacturer shall be Lutron Electronics or Facilities Management approved equivalent.

Wireless lighting controls shall be considered on renovation projects for system flexibility and ease of installation. Wireless shall have a minimum communication range of 30 feet through construction material and 60 feet line of sight.

Warranty: Provide a minimum two year warranty to include 100-percent replacement parts coverage and 100-percent manufacturer labor coverage to troubleshoot and diagnosis a lighting issue. Telephone technical support to be available 24 hours per day, 7 days per week, excluding manufacturer holidays.

PART 2. INCLUDE IN CONSTRUCTION DOCUMENTS

All lighting controls shall meet ANSI/ESD S20.20, NECA 130, UL 20, UL 1472, and NFPA 70. Provide products listed and classified by Underwriters Laboratories Inc. as suitable for the purpose specified and indicated.

Unless specifically indicated to be excluded, provide all required conduit, wiring, connectors, hardware, components, accessories, etc. as required for a complete operating system.

All wired occupancy sensors shall have the following features:
   Capable of sensing both major motion (such as walking) and minor motion (such as small desktop level movements) according to published coverage areas, for automatic control of load indicated.
   Sensor technology: Passive Infrared/Ultrasonic Dual Technology
   Provide LED to visually indicate motion detection with separate color LED for each sensor type in dual technology units.
   Operation: Unless otherwise indicated, occupancy sensor to turn load on when occupant presence is detected and to turn load off when no occupant presence is detected during an adjustable turn-off delay time interval.
   Field configurable turn-on and hold-on activation with settings for activation by either or both sensing technologies.
   Turn-off Delay: Field adjustable, up to a maximum time delay setting of not less than 15 minutes and not more than 30 minutes.
   Power Packs for Low Voltage Occupancy Sensors: Plenum rated, self-contained low voltage class 2 transformer and relay compatible with specified low voltage occupancy sensor for switching of line voltage loads. Input supply voltage shall be dual rated for 120/277V. Provide quantity and configuration of power and slave packs with all associated wiring and accessories as required to control the load indicated on the drawings.
Where wired sensors are indicated, wireless sensors are acceptable provided that all components and wiring modifications necessary for proper operation are included.

All wireless occupancy sensors shall have the following features:
- Does not require external power packs, power wiring, or communication wiring.
- Power: Battery-operated with minimum ten-year battery life.
- Capable of being placed in test mode to verify correct operation from the face of the unit. Provides a clearly visible method of indication to verify that motion is being detected during testing and that the unit is communicating to compatible RF receiving devices.
- Sensing Mechanism: Passive infrared (PIR) coupled with technology for sensing fine motions.

Provide temporary mounting means for drop ceilings to allow user to check proper performance and relocate as needed before permanently mounting sensor. Temporary mounting method to be designed for easy, damage-free removal.
- Programmable to operate as an occupancy sensor (automatic-on and automatic-off), or a vacancy sensor (manual-on and automatic-off).
- Turn-off Delay: Field adjustable, up to a maximum time delay setting of not less than 15 minutes and not more than 30 minutes.

All in-wall occupancy sensors shall have the following features:
- Designed for installation in standard wall box at standard wall switch mounting height with a field of view of 180 degrees, integrated manual control capability, and no leakage current to load in off mode.
- Manual-Off Override Control: When used to turn off load while in automatic-on mode, unit to revert back to automatic mode after no occupant presence is detected during the delayed-off time interval.
- Passive Infrared (PIR): Capable of detecting motion within an area of 900 square feet.

All wired daylighting controls shall have the following features:
- System Description: Control system consisting of photo sensors and compatible control modules and power packs, contactors, or relays as required for automatic control of load indicated according to available natural light; capable of integrating with occupancy sensors and manual override controls.
- Daylighting Control Dimming Modules for Low Voltage Sensors: Low voltage class 2 control unit compatible with specified photo sensors and with specified dimming ballasts/drivers, for both continuous dimming of compatible dimming ballasts/drivers and switching of compatible power packs, contactors, or relays in response to changes in measured light levels according to selected settings
- Operation: Unless otherwise indicated, specified load to be continuously brightened as not enough daylight becomes available and continuously dimmed as enough daylight becomes available. Load to be turned off when available daylight is sufficient to fully dim the load.
- Power Packs for Low Voltage Daylighting Control Modules: Plenum rated, self-
contained low voltage class 2 transformer and relay compatible with specified low voltage daylighting control modules for switching of line voltage loads. Input supply voltage shall be dual rated for 120/277V. Provide quantity and configuration of power and slave packs with all associated wiring and accessories as required to control the load indicated on the drawings.
Where wired sensors are indicated, wireless sensors are acceptable provided that all components and wiring modifications necessary for proper operation are included.

All wireless daylighting controls shall have the following features:
- Does not require external power packs, power wiring, or communication wiring.
- Power: Battery-operated with minimum ten-year battery life.
- Partially shielded for accurate detection of available daylight to prevent fixture lighting and horizontal light component from skewing sensor detection.
- Provide linear response from 2 to 150 footcandles.
- Provide temporary mounting means for drop ceilings to allow user to check proper performance and relocate as needed before permanently mounting sensor. Temporary mounting method to be design for easy, damage-free removal.

All Wall Dimmers and Switches shall have the following features:
- Provide control stations of type, rating, and configuration as indicated or as required to control the loads as indicated.
- Surge Tolerance: Designed and tested to withstand surges of 6,000V, 200 amps according to IEEE C62.41.2 without impairment to performance.
- Dimmers: Provide full range, continuously variable control of light intensity.
- For wireless controls: Communicates directly to compatible RF receiving devices through use of a radio frequency communications link. Allows for easy reprogramming without replacing the unit. Does not require external power packs, power, or communication wiring. Capable of being mounted with a table stand or directly to a wall under a faceplate. Battery-operated with a minimum ten-year battery life.

PART 3 EXECUTION

Electrical Contractor shall install products in accordance with manufacturer’s instructions.

Within the design intent, reasonably minor adjustments to locations of sensors may be made in order to optimize coverage and avoid conflicts or problems affecting coverage.

Ensure that daylight sensor placement minimizes sensor view of electric light sources. Locate ceiling-mounted and luminaire-mounted daylight sensors to avoid direct view of luminaire.

Manufacturer’s startup services may or may not be required. Check with manufacturer.

CONSIGNMENT DESIGN GUIDELINE

Generally, the contractor will furnish and install transformer, primary cables, secondary cable connectors, C.T.'s, and metering equipment. The contractor will make secondary cable connections to the transformer. There may be cases where the new facility is being constructed outside the limits of the UofA power grid. In those cases primary voltage transformers and connections may be provided by the electric service company.

Coordinate all service and metering details:

Southwestern Electric Power Company (SWEPCO)
A unit of American Electric Power
101 W. Township Street
Fayetteville, Arkansas 72702
(479) 973-2324

The University of Arkansas has a good relationship with SWEPCO and we advise early conversation with the power provider to coordinate all aspects of the new design.

If the facility is not going to be on the UofA electric power grid, the local power company will determine metering requirements based on the electrical service entrance size. Coordinate the exact metering requirements with the local power company prior to start of construction.

Contractor shall furnish written confirmation to architect/engineer regarding available fault current prior to connection of service (amps interrupting capacity-AIC). Information shall include AIC-RMS line to line and line to neutral at service transformer secondary connections.

Contractor shall be responsible for all fees and charges incurred for the installation and/or modification of the electrical service as required by the General Contractor. Contractor shall include these fees and charges in the electrical base bid.

SECTION 26 24 13
SWITCHBOARDS

CONSULTANT DESIGN GUIDELINE

Acceptable manufacturers shall be Challenger, Cutler-Hammer, Siemens, Square D, or Facilities Management approved equal.

INCLUDE IN CONSTRUCTION DOCUMENTS

Provide submittal data for the following:
Manufacturer and model:
Housing, Buses, and Breakers.

Type 1 switchboard shall be front accessible with the following features:

Main breaker shall be individually mounted and compartmentalized.
Feeder breakers shall be panel mounted.
Section alignment shall be as shown on the manufacturers' data.

Main section line and load terminals shall be accessible from front and side. Distribution section line and load terminals shall be accessible from the front. Bus connections shall be accessible from the front and end.
Switchboard shall have bolted line and load connections.
Wiring gutter covers shall be full height for access to wiring terminals.

Provide a completely enclosed steel enclosure not less than the gauge required by the standards. The enclosure is to consist of the required number of vertical sections bolted together to form one metal enclosed rigid switchboard. Cover the sides, top, and rear with removable screw on sheet steel plates.

Provide ventilating louvers where required to limit the temperature rise of current carrying parts. Protect all openings against entrance of falling dirt, water, or foreign matter.

Buses shall be arranged for 3-phase, 4-wire distribution. Main phase buses (through bus), full size neutral bus, and ground bus shall be full capacity the entire length of the switchboard. Provide for future extensions by means of boltholes or other approved method. Brace the bus to withstand the available short circuit current at the particular location as shown on the drawings. No magnetic material shall be between buses to form a magnetic loop.

Buses and connections shall be hard drawn copper. Bus temperature rise shall not exceed 65°C. Current density shall not exceed 1200 amperes per square inch for copper. Size section busing based on the sum total of breakers served to permit operation of each unit at not less than 125 percent of its trip rating or 50 percent of the frame size, whichever is greater.
Provide bare bus and mount on insulated bus supports. Provide neutral disconnect link to permit isolation of neutral bus from the common ground bus and service entrance conductors.

Provide un-insulated ¾” x 2” copper equipment ground bus bar the length of the switchboard and secure at each section.

Connect an un-insulated ¾” x 2” copper bus between the neutral and ground buses to establish the system common ground point.

Provide 20%, minimum, space for future.

Where draw out circuit breakers are provided, furnish a portable elevating carriage or switchboard-mounted device for installation and removal of the breakers.

Control wiring shall be 600-volt class B stranded SIS. Install all control wiring complete at the factory adequately bundled and protected. Wiring across hinges and between shipping units shall be class C stranded. Size wire in accordance with NEC. Provide control circuit fuses.

Main breakers shall be low voltage AC power type, dead front, stored energy with solid-state trip devices. Arcing contacts shall be renewable.

Rating shall be 3-pole, 600 volts AC, 60-cycle with frame size, trip rating, system, voltage, and interrupting rating as shown on the drawings.

Provide draw out mounting for breakers over 1600 amperes and where shown on the drawings. A racking mechanism shall position and hold the breaker in the connected, test, and disconnect positions. An interlock shall prevent movement into or out of the connected position unless the breaker is tripped open.

Provide an indicator visible from the front of the unit to indicate whether the breaker is open or closed.

Provide a mechanical trip button accessible from the front of the door to trip the breaker.

Include provisions for padlocking the breaker in the open position.

Manually operate breakers 1600-ampere frame size and less.
Electrically operate breakers larger than 1600-ampere frame size

26 28 00 Low-Voltage Circuit Protective Device

SECTION 26 28 00
SWITCHES AND FUSES

CONSULTANT DESIGN GUIDELINE

Switches shall be heavy duty, Type HD, and horsepower rated as required.

Manufacturer shall be Challenger, Cutler-Hammer, Siemens, Square D, or Facilities Management approved equal.

INCLUDE IN CONSTRUCTION DOCUMENTS

Switches shall be quick-make, quick-break type in accordance with UL98, National Electrical Manufacturers Association (NEMA) KS1, and NEC.

Switches shall be capable of accepting UL and NEMA standard fuses.

Switches shall have the following features:
Switch shall have copper blades, which shall be visible in the OFF position.
Switch shall have an arc chute for each pole.
External operating handle shall indicate ON and OFF position and shall have lock-open padlocking provisions.
Mechanical interlock shall permit opening of the door only when the switch is in the OFF position.
Fuse mounting shall be for the size and type of fuses shown on the drawings. Furnish switches completely fused. Furnish a complete set of spare fuses for each switch being installed. Deliver to the Owner additional sets of spare fuses to constitute not less than two complete sets for the type, size, and rating of each set installed.
Switch shall have a solid neutral for each switch being installed in a circuit that included a neutral conductor.
Switch shall have grounding Lug for connection of the grounding conductor.
Enclosures shall be the NEMA types shown on the drawings for the switches. Where the types of switch enclosures are not shown, they shall be the NEMA types that are most suitable for the environmental conditions where the switches are being installed.

SECTION 26 29 23
VARIABLE FREQUENCY MOTOR CONTROLLERS

Checklist for Basic Requirements

A. Need for bypass
B. Hardware points
C. Software points
D. BACNet or ModBus

CONSULTANT DESIGN GUIDELINE

Variable frequency controller shall be UL listed and shall conform to latest standards of ANSI and IEEE requirements.

Variable frequency drives may be one of the commodity items available through the UofA IDIQ procurement system. The consultant should inquire with Facilities Management about the current status of procurement.

The controller shall comply with FCC Rules and Regulations, Part 15, Subpart J for emissions of conducted and radiated RFI.

Manufacturer shall be Danfoss or Facilities Management approved equal. 

INCLUDE CONSTRUCTION DOCUMENTS

Contractor shall provide manual for starting and operating controllers, complete with operating limits, wiring diagram, and maintenance schedule.

Manufacturer shall furnish maintenance of controller for one year from Date of Substantial Completion.

The controller shall have capability of allowing the motor to be disconnected at the safety “disconnect” switch without damage to the controller’s electronics.
Controller shall have a displacement power factor of 0.95 or greater, lagging over entire range of operating speed and load.

Minimum efficiency at full load shall be 96 percent.

Additional required features shall be as follows:
Controller shall have integral digital display to indicate voltage, output frequency, and output current.
Controller shall have status indicators for over-current, over-voltage, ground fault, over-temperature, and input power ON.
Unit shall have current limit adjustment from zero to 100 percent of rated load.
Both acceleration and deceleration rate shall be adjustable from three to 60 seconds.
Unit shall have HAND-OFF-AUTOMATIC switch and manual speed control.
Provide terminal for remote contact to allow starting under both manual and automatic modes.
Provide a manual bypass, overload motor protection, short circuit protection for full voltage, non-reversing operation of the motor. Include isolation switch to allow maintenance of inverter during bypass operation.
Include integral fused disconnect switch on the line side of each controller.
Controller shall have internal 115-volt control power with transformer and protective fuses.
Cabinet shall have door mounted speed indicator and ammeter.
Drive shall have automatic restart capability after power failures.
Unit shall have a diagnostic panel consisting of LED indicators of the following conditions: over voltage, under voltage, over current, underload timer on, run, fault, auto/manual, clipper, 6 inverter, input bus charged, input surge cycle complete, and output bus charged.

Contractor shall provide two of each type of air filter and three of each size and type of fuse.

SECTION 26 50 00 LIGHTING

CONSULTANT DESIGN GUIDELINE

1) Vault Lighting

   a. Install (2) ceiling mounted units inside the vault – Canlet Ceiling Mount 68-02IFC(screw base) -01-OG-09 [ceiling mount, with incandescent screw base, with clear glass globe and cage guard]
   b. Install (1) wall mounted unit outside in the pit – Canlet Wall Mount 68-02IWF-01-01-01 + 68WME02 [wall mount, with incandescent screw base, with reflector, clear glass globe and cage guard with white reflector + wall mount extension bracket]
   c. Lighting should be switched from inside the vault on the line side of the GFCI if that is allowed so that nuisance trips on the GFCI do not kill the lighting.
   d. We do want CFL lighting but not with a separate ballast. We don’t really want to use fixed ballast fixtures, but rather screw base CFLs. Otherwise when a ballast fails, we have to get an electrician to fix it as opposed to just changing the bulb.

End of Section

SECTION 26 51 00
INTERIOR LIGHTING

CONSULTANT DESIGN GUIDELINE

Lighting levels should not exceed the minimum recommended by the IES guideline.

Submit fixture and dimming information in accordance with Plan Review and Submittals.

Provide fluorescent light fixtures with parabolic lenses general for building lighting. Use specification grade fluorescent fixtures with conventional lenses in storage rooms, toilets, corridors, etc. Use HID fixtures in areas that have high ceilings.

Use “Lay-in” mounted light fixtures in areas that have suspended acoustic tile ceilings.

Fluorescent fixture lenses shall be 0.156" thick, minimum.

Obtain and specify electronic ballasts in accordance with ballast specifications issued by the Office of State Purchasing, Department of Finance and Administration, PO Box 2940, Little Rock, AR 72203 (501) 324-9316.

In areas requiring a dimmer system, secondary incandescent fixtures may be used with primary general fluorescent lighting.
Exit lights shall be LED as manufactured by Hubbell.

The recommended lighting energy allowance is no greater than two watts per building gross square feet.

**INCLUDE IN CONSTRUCTION DOCUMENTS**

Submit all lighting for review and approval by Facilities Management.

**EXECUTION**

No lights shall be located over stairwells. Lights shall be over landings, or wall mounted only.

**SECTION 26 56 00**

**EXTERIOR LIGHTING**

**CONSULTANT DESIGN GUIDELINE**

Use campus standard exterior light fixtures. Cut sheets for approved fixtures are included in folder “Campus Furnishings Standards” of this Guide.

Provide a photometric analysis for all exterior lighting layouts, and submit to Facilities Management Planning Group for approval. Photometrics should follow the campus lighting guidelines as established in Part Two: Planning Guidelines, Section 2.1 C (see Facilities
Management, Planning Group web page).

INCLUDE IN CONSTRUCTION DOCUMENTS

Pole lighting voltage shall be either 208 or 460. 120 volt pole lighting is unacceptable. Voltage drop in lighting circuits shall not exceed 7%.

EXECUTION

Exact location of exterior light fixtures shall be coordinated with Facilities Management Planning Group. No uplighting allowed.
